

# Mercedes-Benz Anticipating the Cookie Apocalypse

By Kevin Rollier

# Adapting to the shift towards privacy-first measures

## Challenges

**Reaching luxury car owners & potential buyers**

**Signal loss with cookie deprecation in apple & firefox**

**Activating CRM data and privacy regulations in digital advertising.**

**Traditional cookie-less solutions like contextual delivers considerable wastage**

# Our solution

## Calculate IPs

Mathematically produce all possible IP addresses in each country. No data is collected

208.67.222.222  
208.67.222.223  
208.67.222.224  
208.67.222.22X

## Locate IPs

Probabilistic geo-position to link IP addresses to neighborhoods

## Create maps

Match offline data from national statistics offices with digital geolocation, building neighborhoods of 100-500 households that share similar statistical attributes

## Segment IPs

Once households are located and neighborhood cohorts are created, location data is removed, leaving only IP addresses matched to household characteristics

We create neighbourhood maps based on demographic cohorts surpassing the granularity and accuracy of postcodes

The methodology is 100% probabilistic, containing zero personal information; the IP addresses are calculated, not collected from events,

And there is no logging or tracking, making it the most privacy-secure data in the industry

# An innovative targeting strategy

**A clear win for the  
cookie-less future**

**IP addresses backed by  
demographic insights**

**real-world data for  
online targeting**

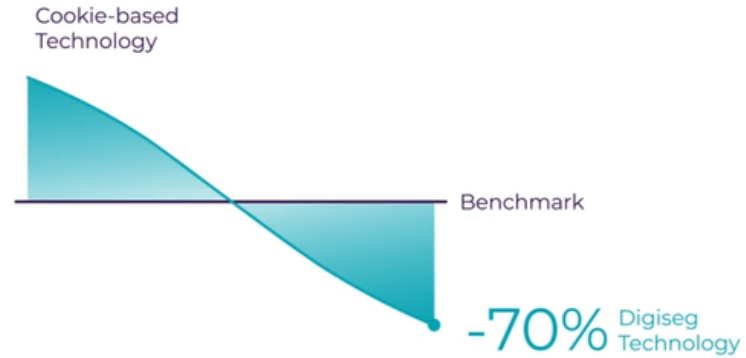

# The results

## Conversion Rate

**180%** better

## CPL

**70%** better

# Case movie

# Why an AMMA?

**Forward-thinking approach that  
achieved its marketing objectives  
with remarkable success**

**PHD is the first one in Belgium to  
use Digiseg's privacy-compliant,  
probabilistic targeting methodology.**

**Mercedes-Benz and PHD are ready for post-cookie apocalypse.**
